

ABSTRACT

A method and system for automated provisioning of hybrid fiber coax (HFC) network elements operable for communicating telephony, data, and video signals with customer-premises equipment of a subscriber includes a database and an online provisioning application link (OPAL). The database is operable for storing data indicative of the configuration of the network elements and the customer-premises equipment, and for storing data indicative of assigned capacity of the network elements. The OPAL is operable with the database for provisioning network elements with the customer-premises equipment of the subscriber based on the assigned capacity of the network elements in order to enable communication of telephony, data, and video signals between the HFC network and the customer-premises equipment of the subscriber.
